ACKNOWLEDGMENTS

This User's Guide and the accompanying Codebook and data file were produced by the Center for Studying Health System Change (HSC) in collaboration with its contractors, Mathematica Policy Research, Inc. (MPR) and Social and Scientific Systems, Inc. (SSS). James Reschovsky of HSC provided overall direction for the survey database development and the production of the Public Use File and documentation, David Edson of MPR provided ongoing supervision and coordination to this project, and Ase Sewall of SSS supervised the production of the data file and the Codebook.

The development of the data file, including editing, imputation, and new variable construction, was largely performed by Ellen Singer and Leif Karell of SSS, with assistance from Monica Briggs of SSS. Survey weights and procedures for variance estimation were developed by John Hall, Frank Potter, and Barbara Lepidus Carlson of MPR. Guidance in the data file construction was provided by HSC staff members Marie Reed, Robert St. Peter, and James Reschovsky. David Edson, Ellen Singer, and Marie Reed had primary roles in developing the data confidentiality procedures, with the assistance of Thomas Jabine, an independent data confidentiality consultant, and Portia DeFilippes of MPR.

Barbara Lepidus Carlson was the primary author of Chapters 1 through 3 of the User's Guide. Ellen Singer was the primary author of Chapters 4 and 5, with assistance provided by Paula Beasley of SSS. David Edson developed the logic and skip pattern flowcharts in Appendix B. Barbara Lepidus Carlson wrote Appendix C, which explains the derivation of the standard error tables, with assistance from John Hall. John Hall developed the standard error look up tables in Appendix D, with the assistance of Bryan Sayer of SSS. Editorial support was provided by Daryl Hall and Anne Kelleher of MPR. James Reschovsky and David Edson participated in all components of the User's Guide development. Helpful comments on an earlier draft were received from Peter Kemper, Sally Trude, and Andrew Epstein of HSC.

The Codebook was developed primarily by Ellen Singer, with assistance from Ase Sewall, Marie Reed, Paula Beasley, Raymond Hu of SSS, and Jenny Chang of SSS.

PREFACE

This User's Guide gives researchers the information necessary to use the Community Tracking Study (CTS) Physician Survey Public Use File developed by the Center for Studying Health System Change (HSC). The Guide presents background information about the CTS and the Physician Survey, explains the various samples and weight variables, and provides standard error look-up tables. This discussion is followed by a description of variable construction and editing, and other information about the data file. A copy of the survey questionnaire appears in Appendix A. The publication, "Community Tracking Study Physician Survey Public Use File: Codebook," provides more detail on the file, including frequencies and definitions of variables. The Public Use File and the latest documentation are available through the Inter-university Consortium for Political and Social Research (ICPSR) at www.icpsr.umich.edu. Additional technical assistance may be obtained by contacting the CTS Public Use File Help Desk by e-mail (ctshelp@hschange.com) or fax (202-863-1763).

Chapter 1

Overview of the Community Tracking Study and the Physician Survey

This User's Guide is intended to assist researchers in using the Community Tracking Study (CTS) Physician Survey Public Use File. Programmer documentation and detailed information on the file layout and content are available in the CTS Physician Survey Public Use File Codebook. Information about other aspects of the CTS is available from the Center for Studying Health System Change (www.hschange.com) or via e-mail (center@hschange.com).

1.1. CTS Objectives

The CTS is a national study of the rapidly changing health care market and the effects of these changes on people.¹ Funded by the Robert Wood Johnson Foundation, the study is being conducted by the Center for Studying Health System Change (HSC). The overall goal of the study—to develop an information base designed to track and analyze change in the nation's health care market and to inform public and private decision makers about these changes—has three component objectives:

Tracking Changes in Health Systems. The study's first objective is to document changes in the health system through intensive study of selected communities. The major changes that have been reported in the health system include consolidation of the market at all levels (medical groups, hospitals, insurers, and health plans); vertical integration of providers (for example, hospitals and physicians) and of insurers and providers; increased risk sharing by providers; growth of large, national, for-profit health care enterprises; and the adoption of new techniques for managing clinical care (clinical information systems, quality improvement techniques, utilization management, and so forth).

Tracking Changes in Access, Service Delivery, Cost, and Perceived Quality. The second objective of the study is to monitor the effects of health system change on people by tracking indicators of these effects. The effects could be favorable or unfavorable, and they involve service use and delivery, changes in access to care, and quality and cost of care.

Understanding the Effect of Health System Change on People. The third objective of the study is to understand how differences in health systems are related to differences in access, service delivery, cost, and perceived quality. This objective will be achieved by

¹An overview of the Community Tracking Study is contained in Kemper et al. "The Design of the Community Tracking Study: A Longitudinal Study of Health System Change and Its Effects on People." *Inquiry*, vol. 33, Summer 1996, pp. 195-206.

analyzing—qualitatively and quantitatively—the relationship between health systems and access, service delivery, cost, and perceived quality.

Central to the design of the study is its community focus. This focus was established because health care delivery is primarily local and differs from one community to the next as a result of history, culture, and state and local policy. Therefore, to analyze and understand institutional changes in the delivery system and their effects on people, we need information at the local level. To this end, 60 communities, listed in Table 1.1, were randomly selected to form the core of the CTS and to be representative of the nation as a whole.² Of these communities, 12 were randomly chosen for more intensive study. These are referred to as the high-intensity sites.

1.2. Analytic Components of the Community Tracking Study

The CTS has qualitative and quantitative components. For instance, case studies are being conducted in the 12 high-intensity sites. The first round of comprehensive case studies of the health system were begun in 1996 and continued through 1997. The findings are available from HSC.³ This qualitative information is accompanied by survey data from these 12 communities and from an additional 48 sites. In all 60 sites, HSC simultaneously conducted independent surveys of households, physicians, and employers, enabling researchers to explore relationships among purchasers, providers, and consumers of health care.⁴ The Followback Survey of Health Plan Organizations is another component of the CTS. Respondents to the CTS Household Survey covered by privately financed health insurance plans (employer, union, and privately purchased) will be “followed back” to the organization that administers the plan. The administering plan will provide information on available health plans and will identify the particular plan in which each linked respondent policyholder is enrolled. Measured health plan attributes include whether the plan is a managed care plan (and if so, the type of managed care plan it is), health plan network size, and provider payment methods.

Data is being collected on a two-year cycle, allowing researchers to track changes in the health care system over time. The round one surveys and case studies, completed during 1996 and 1997, are the baseline. Data collection for round two began in the summer of 1998.

²The CTS focuses on the contiguous 48 states. Alaska and Hawaii were not part of the study.

³Center for Studying Health System Change. *Health System Change in Twelve Communities*. Washington, DC: HSC, September 1997. Available at www.hschange.com.

⁴The household survey was conducted by HSC and is available as a Public Use File. The employer survey was conducted by RAND, in collaboration with HSC. While these surveys were conducted in the same communities, they were independent of one another and do not allow linking of persons or employers to specific physicians.

*Based on 1995 Census estimates.

1.3. The Physician Survey

The Physician Survey, funded by the Robert Wood Johnson Foundation, was conducted under the direction of HSC. The Gallup Organization was the primary contractor for survey implementation, including sampling, interviewing, and weighting. Mathematica Policy Research, Inc. (MPR) was responsible for sample design and variance estimation. Project Hope and CODA, Inc. assisted in developing the instrument, including cognitive testing. Social and Scientific Systems, Inc. (SSS) was instrumental in converting the raw survey data into a data file suitable for analysis. MPR and SSS collaborated to prepare the documentation for the Public Use File.

The Physician Survey instrument collected information on physician supply and specialty distribution; practice arrangements and physician ownership; physician time allocation; sources of practice revenue; level and determinants of physician compensation; provision of charity care; physicians' perception of their ability to deliver care and of career satisfaction; effects of care management strategies; and various aspects of physicians' practice of medicine. For primary care physicians (PCPs), the instrument also contained vignettes including various clinical presentations for which there is no prescribed method of treatment. Physicians were asked to state the percentage of patients for whom they would recommend the course of action specified in each particular vignette.

The survey was administered completely by telephone, using computer-assisted telephone interviewing technology. The sample frame was developed by combining lists of physicians from the American Medical Association (AMA) and the American Osteopathic Association (AOA). Bilingual interviewers were used in the few cases where needed. Interviews with 12,385 physicians⁵ were completed between August 1996 and August 1997.

1.4. Physician Survey Public Use File and Restricted Use File

Two versions of the CTS Physician Survey data are available to researchers: the Restricted Use File and the Public Use File. The *Restricted Use File* may be accessed only under the conditions listed in the *Community Tracking Study Physician Survey Restricted Data Use Agreement*. This agreement provides details on ownership of the data, when the data may be accessed and by whom, how the data may be used, the data security procedures that must be implemented, and the sanctions that will be imposed in the case of data misuse. Researchers must specifically apply for use of the Restricted Use File. Copies of the agreement and a description of the application process are available from the ICPSR web site at www.icpsr.umich.edu.

The Restricted Use File is provided to researchers for use on only a specific research project (new applications would be required for subsequent analyses using the data) and for a limited time period, after which all copies of the data must be destroyed. Moreover, researchers using the

⁵There are 12,528 physician records on the file; 143 physicians were sampled twice and therefore appear on the file twice, even though they completed only one interview each. Sampling weights were constructed so that duplicate records do not bias results. Consequently, researchers should not delete the duplicate records.

Restricted Use File may be required to undertake costly or inconvenient security measures. Researchers who are interested only in producing site-level means from the physician data, whether to perform analysis using a site-level file or to merge onto one of the other CTS component surveys, may choose instead to wait for the forthcoming site-level mean file. Researchers are encouraged to review documentation for both the Public Use and Restricted Use files, available from ICPSR at www.icpsr.umich.edu, as well as the requirements of the *Community Tracking Study Physician Survey Restricted Data Use Agreement*, before deciding which file will meet their needs.

The ***Public Use File*** is available from ICPSR to all researchers with minimal restrictions. Researchers need not specifically apply for use of the Public Use File. It is suitable for most researchers who wish to perform analysis at the national level and do not anticipate using the site-level information in their analysis. The Public Use File does not support analysis at the site level or analysis that uses site-level information. Although it contains all of the same observations as the Restricted Use File, several variables have been deleted or modified slightly for data confidentiality reasons (see below). Moreover, information necessary for using statistical software programs that account for the survey design is not included in the Public Use File, necessitating the use of standard error look-up tables or formulas contained in Chapter 3 to derive approximate standard errors. Separate documentation on the Public Use File is available from ICPSR at www.icpsr.umich.edu.

As stated above, this Public Use File does not contain certain data that are available on the Restricted Use File version of the Physician Survey. Other variables in the Public Use File were modified somewhat to ensure the confidentiality of survey respondents. These modifications are described in Chapter 4. Table 1.2 lists the variables available on the Public and Restricted Use versions of the data file. In this table, a different name for the same variable on the Public Use and Restricted Use files (the Public Use name ends in “X”) indicates that the data for this variable underwent additional editing for confidentiality.⁶

⁶INCOMEX (on both files) has also been edited for confidentiality. SPECX (on both files) was provided on the Restricted Use File as a way to categorize specialty; however, its component variables are found only on the Restricted Use File.

TABLE 1.2

VARIABLES ON THE PHYSICIAN RESTRICTED USE AND PUBLIC USE FILES

Restricted Use Name	Public Use Name	Variable Label (on Restricted Use File)
Survey Administration Variables		
PHYSIDX	PHYSIDX	PH1:Physician identification number
MSACAT	n/a	PH1:Large metro/small metro/non-metro
FIPS	n/a	PH1:State and county code when surveyed
SITEID	n/a	PH1:Updated master file SITE variable
SUBGRP	n/a	PH1:Subgroup in sample - A/B/C/D
DOCTYP	n/a	PH1:S1: Doctor type (MD, DO)

NFRAME	n/a	Sample frame counts for natl estimates
FSU	n/a	Final sample unit for site estimates
NFSU	n/a	Final sample unit for natl estimates
SECSTRA	n/a	Secondary stratification
P1X - P7X	n/a	Joint inclusion probability #1 thru #7
WTPHY1	n/a	PH1: Augmented site estimates
WTPHY2	n/a	PH1: National estimates, site sample
WTPHY3	n/a	PH1: National estimates, supplemental sample
WTPHY4	WTPHY4	PH1: National weight, combined sample
WTSITE	n/a	PH1: Relative weight for sites 1-60

Notes: "n/a" identifies variables that are not available on the CTS Physician Survey Public Use File. Variable label contains a brief description of the variable. In some cases, the label also provides information on the source of the variable (e.g., PH1 for the Physician Survey) and the question number (e.g., "A6" for Section A, Question 6).

Chapter 2

The Structure and Content of the Community Tracking Study Physician Survey

The Physician Survey was administered to a sample of physicians in the 60 CTS sites and to an independent national sample of physicians. The survey's three-tiered sample design makes it possible to develop estimates at the national and community (site) levels.

- The first tier is a sample of 12 communities from which a large number of physicians in each community were surveyed. The sample in each of these “high-intensity” sites is large enough to support estimates in each site.
- The second tier is a sample of 48 communities from which a smaller sample of physicians in each community was surveyed. This sample of “low-intensity” sites allows us to validate results from the high-intensity sites and permits findings to be generalized to the nation. The first and second tiers together are known as the *site sample*.
- The third tier is a smaller, independent national sample. Known as the *supplemental sample*, this sample augments the site sample and substantially increases the precision of national estimates with a relatively modest increase in the total sample size.

Because identifying a physician's practice location would greatly enhance the ability to identify specific respondents, locational identifiers are not provided in the Public Use File. This file therefore supports only national estimates, while the Restricted Use File supports site-level estimates.

This chapter describes the sample design, the process of conducting the survey, the survey content, survey administration and processing, and the sample and weighting variable to be used for analyses using the Public Use File. The background information on sample design (Sections 2.1 and 2.2) is provided for those who are interested; however, it is not necessary to read these sections in order to use the Public Use File.

2.1. CTS Sample Sites

The primary goal of the CTS is to track health system change and its effects on people at the local level. Determining which communities, or sites, to study was therefore the first step in designing the CTS sample. Three issues were central to this sample design: how sites were defined, how many were studied, and how they were selected.

2.1.1. Definition of Sites

The sites were intended to encompass local health care markets. Although there are no set boundaries for these local markets, the intent was to define areas such that residents predominately used health care providers located in the same area, and providers mostly served area residents. To this end, we generally defined sites to be MSAs (metropolitan statistical areas) as defined by the Office of Management and Budget or, in the case of nonmetropolitan sites, BEAEAs (Bureau of Economic Analysis economic areas).¹

2.1.2. Number of Sites

The next step in creating the site sample was to determine the number of high-intensity sites. In making this decision, we considered the tradeoffs between data collection costs (case studies plus survey costs) and the research benefits of a large sample of sites. The research benefits of a larger number of sites include a greater ability to empirically examine the relationship between system change and its effect on care delivery and consumers, and a greater ability to make the study findings more “generalizable” to the nation.

Despite the cost advantages of conducting intensive case studies in fewer sites, focusing on a smaller number of communities makes it more difficult to distinguish between changes of general importance and changes or characteristics unique to a community. Solving this problem by increasing the number of case study sites would make the cost of data collection and analysis prohibitively high. We therefore chose 12 sites for intensive study and added to this sample 48 sites that would be studied less intensively. These 60 high-intensity and low-intensity sites form the *site sample*.

Although there was no formal scientific basis for choosing 12 high-intensity sites, this number reflects a balance between the benefits of studying a range of different communities and the costs of doing so. The addition of 48 low-intensity sites solves the problem of limited generalizability associated with only 12 sites and provides a benchmark for interpreting the representativeness of the high-intensity sites.

2.1.3. Site Selection

Once the number of sites for the site sample was determined, the next step was to select the actual sites. Shown previously in Table 1.1, the 60 sites, or “primary sampling units,” were chosen for the first stage of sampling. Sites were sampled by stratifying them geographically by region and selecting them randomly, with probability in proportion to their 1995 population. There were

¹For more details on the definition of CTS sites, refer to C. Metcalf, P. Kemper, L. Kohn, and J. Pickreign. *Site Definition and Sample Design for the Community Tracking Study*. Technical Publication No. 1. Washington, DC: Center for Studying Health System Change, October 1996). Note in particular the discussions of New England, where MSAs do not conform with county lines; note also the discussions of the large Consolidated Metropolitan Statistical Areas.

separate strata for small MSAs (population of less than 200,000) and for nonmetropolitan areas. This sampling approach provided maximum geographic diversity, judged critical for the 12 high-intensity sites in particular, and acceptable natural variation in city size and degree of market consolidation.²

The 12 high-intensity sites were selected randomly from MSAs with a 1995 population of 200,000 or greater. Of the 48 low-intensity sites, 36 are large metropolitan areas (also having a 1995 population of 200,000 or greater), 3 are small metropolitan areas (population of less than 200,000), and 9 are nonmetropolitan sites.

Together, the high-intensity and low-intensity sites account for about 90 percent of all survey respondents. This site sample can be used to make national estimates. The sample may also be used to make site-specific estimates for the high-intensity sites (which is possible only with the Restricted Use File of the Physician Survey).

2.2. Additional Samples and Better National Estimates

While the site sample alone will yield national estimates, they will not be as precise as they would have been had even more communities been sampled or had the sample been a simple random sample of the entire U.S. population. The *supplemental sample*, the third tier in the design of the CTS Physician Survey sample, was added to increase the precision of national estimates at a relatively small incremental increase in survey cost.

The supplemental sample is a relatively small, nationally representative sample made up of physicians randomly selected from the 48 states in the continental United States and the District of Columbia. It is stratified by 10 geographic regions (based on the groupings used in the AMA system) crossed with the two physician types (primary care versus specialist), but essentially uses simple random sampling techniques within strata. The supplemental sample and the site sample together are called the *combined sample*. Because component samples are not identified, all analyses using the Public Use File are based on the combined sample.

Figure 2.1 illustrates the sample design. The shaded area shows both the cases sampled in site 2 as part of the site sample and the supplemental sample cases that happened to fall within the site 2 boundaries. National estimates may only be obtained from the combined sample when using the Physician Survey Public Use File.

²Additional information about the number of sites and the random selection of the site sample is available in C. Metcalf, P. Kemper, L. Kohn, and J. Pickreign. *Site Definition and Sample Design for the Community Tracking Study*. Technical Publication No. 1. Washington, DC: Center for Studying Health System Change, October 1996.

	Other areas (625 physicians)

2.3. Conducting the Survey

After selecting the sample sites, we randomly selected physicians within each site. We also randomly selected physicians for the supplemental sample. The AMA and the AOA constructed the sample frames and drew the samples based on specifications provided to them by the project team.

2.3.1. Eligible Physicians

The AMA used its Masterfile (which includes nonmembers) as the source for its sampling frame, and the AOA used its membership file. To meet the initial eligibility criteria for sampling, physicians on the frame had to have completed their medical training,³ be practicing in the contiguous United States, and be providing direct patient care for at least 20 hours per week.⁴ Among those deemed initially eligible, the following types of physicians were specifically designated as ineligible for this survey and were removed from the frame:

- Specialists in fields in which the primary focus is not direct patient care⁵
- Federal employees
- Graduates of foreign medical schools who are only temporarily licensed to practice in the United States

The AMA was also asked to exclude osteopathic physicians (D.O.s) from its frame because the sample of osteopaths was to be provided directly by the AOA. Furthermore, the AMA also excluded from its frame those physicians who were sampled for its 1996 Sociometric Monitoring System survey as well as those who specifically requested that their names not be released to

³ Residents, interns, and fellows were considered to be still in training.

⁴This criteria resulted in the exclusion of of inactive physicians and physicians who were not office- or hospital-based (teachers, administrators, researchers, etc.).

⁵Radiology (including diagnostic, nuclear, pediatric, neuro-, radiation oncology, radiological physics, vascular, and interventional); anesthesiology; pain management; pain medicine; palliative medicine; pathology (including anatomic, clinical, dermato-, forensic, neuro-, chemical, cyto-, immuno-, pediatric, radioisotopic, selective); medical toxicology; aerospace medicine and undersea medicine; allergy and immunology/diagnostic laboratory; bloodbanking/transfusion medicine; clinical and laboratory dermatological immunology; forensic psychiatry; hematology; legal medicine; medical management; public health and general preventive medicine; nuclear medicine; clinical pharmacology; sleep medicine; other specialty; unspecified specialty.

outsiders. Those in this “do not release name” group were later classified as nonrespondents for the purpose of weighting adjustments for nonresponse.

2.3.2. Stratification of Physician Sample Frames

Once the AMA and AOA constructed their lists of eligible physicians, they classified each physician on their lists as either a primary care physician (PCP) or a non-primary care physician (non-PCP). PCPs were defined as those with a primary specialty of family practice, general practice, general internal medicine, internal medicine/pediatrics, or general pediatrics. All others with survey-eligible specialties were classified as non-PCPs.

The AMA and AOA each developed two sampling frames: one for the site sample and one for the supplemental sample. The physician’s location for sampling purposes was determined by the AMA/AOA preferred mailing address. Within each site, each organization selected a systematic sample of PCPs and a systematic sample of non-PCPs, based upon an optimal sample-allocation plan. This allocation plan was based on the relative number of M.D. and D.O. physicians in each site. The plan resulted in 240 separate site samples (2 organizations, 2 specialty types, 60 sites). PCPs were oversampled in the site sample.

For the supplemental sample, the sample frame was divided into the following 10 geographic strata:

1. New England (CT, ME, MA, NH, RI, VT)
2. New York
3. Middle-South Atlantic (DE, NJ, PA, WV)
4. South Atlantic (DC, GA, MD, NC, SC, VA)
5. East South Central (AL, FL, KY, MS, TN)
6. West South Central (AR, LA, MO, OK, TX)
7. East North Central (IN, MI, OH)
8. North Central (IL, IA, MN, WI)
9. Mountain-Pacific (AZ, CO, ID, KS, MT, NE, NV, NM, ND, SD, OR, UT, WY, WA)
10. California

Each organization selected a stratified random sample of physicians, independent of the site sample, where the 20 strata were defined by the 10 geographical strata and by specialty type (PCP vs. non-PCP). A systematic sample was drawn within each of the 20 strata.

Because the site and supplemental samples were drawn independently, it was possible for some physicians to be selected into both samples; in fact, 143 physicians were selected twice. These twice-selected physicians were only interviewed once, but they appear as two different records on the file. Each has a unique identifier and was dealt with appropriately in the weighting process. Thus, as is mentioned in Chapter 1 (footnote 5), researchers do not need to be concerned about deleting duplicate records.

2.3.3. Physicians Excluded from the Survey

Some physicians thought to be eligible based on the sample frame information were later classified as ineligible based on survey responses. This happened if it turned out that the physician was still in training, provided direct patient care for less than 20 hours per week, practiced in an excluded specialty, was a federal employee, or was deceased. These ineligible physicians are not included on the file.

2.4. Survey Content

Respondents to the survey were questioned about the following:

- Physician supply and specialty distribution
- Physician time allocation
- Practice arrangements and ownership
- “Gatekeeping”/Medical care management strategies/Scope of care
- Practice styles (PCPs only)
- Ability to provide care/Ability to obtain needed services for patients/Acceptance of new patients with various types of insurance
- Practice revenue
- Physician compensation

No proxy respondents were allowed for the Physician Survey. All physicians responded to the interview for themselves. Table 2.1 shows the topics covered in the survey in more detail. Detailed documentation for the computer-assisted telephone interview program, the equivalent of a survey instrument, is provided as Appendix A. A set of flowcharts has also been included as Appendix B to assist researchers interested in understanding skip patterns in the survey.

2.5. Survey Administration and Processing

The survey was administered completely by telephone, using computer-assisted telephone interviewing technology. As described earlier, all physicians were selected from list frames compiled by the AMA and the AOA. The survey was fielded between August 1996 and August 1997. For PCPs, the average interview length was 22 minutes; for non-PCPs, the average length was 18 minutes.

The total number of completed interviews was 12,385,⁶ with a response rate among eligibles of 65.4 percent. Physicians were sent two advance letters from the Robert Wood Johnson Foundation and were offered a \$25 honorarium for participating in the survey.

2.6. Analysis Using the Physician Survey

The Physician Survey Public Use File can be used to make national estimates when the physician is the unit of measurement. The sample contains all physicians from the site and supplemental samples combined (n=12,528). The Physician Survey Public Use File is a physician-level file; that is, it includes one data record for each physician responding to the survey.

The weight variable provided on the Public Use File is WTPHY4, which allows for making national estimates with these data. This weight is based on the probability of selection within the sampled site or stratum.⁷

Using the Public Use File, you can do physician-level analyses that involve the study of physicians nationwide (including, for example, subgroups such as PCPs or non-PCPs, U.S.- or foreign-trained physicians, or physicians in large cities). You will not be able to estimate a model that contains explanatory variables that are site characteristics (e.g., site-level means from any CTS component survey) because this would require site identifiers that are not supplied on the Public Use File.

⁶There are 12,528 records on the file because 143 physicians were selected twice for the survey and appear twice on the file, even though they were only interviewed once.

⁷Refer to Keil, L. et al, *Community Tracking Study Physician Survey: Round 1 Survey Methodology Report*, (published as HSC Technical Report Number 9, October 1998) for more details on the definitions and construction of the weight variables, including probabilities of selection and adjustments for physician nonresponse. The weight variable name in the Public Use File, WTPHY4, is referred to as PHNATLWT in the methodology report.

TABLE 2.1

CONTENTS OF THE PHYSICIAN SURVEY

Topic	Description
Physician Supply and Specialty Distribution (Questionnaire Section A)	
Eligibility for survey	Federal employee Less than 20 hours/week Excluded specialty
Practice information	Number of practices Location of primary practice Year began medical practice
Specialty and certification	Primary specialty Board eligibility and certification
Satisfaction	Current level of satisfaction with overall career in medicine
Physician Time Allocation (Questionnaire Section B)	
Weeks worked	Number of weeks practiced medicine in 1995
Hours worked	Hours worked in medicine during last complete week of work Hours spent in direct patient care during last complete week of work
Charity care	Hours spent in charity care in the last month
Time in main practice	Percent of direct patient care time spent in main practice, if more than one practice
Practice Arrangements and Ownership (Questionnaire Section C)	
Ownership of practice	Respondent ownership Other owners Whether physician was part of a practice that was purchased during the past two years
Practice description	Type of practice Number of physicians employed Number of non-physician medical practitioners employed
Gatekeeping / Medical Care Management Strategies / Scope of Care (Questionnaire Section D)	
Medical care management	Effect of various techniques on practice of medicine
PCPs	Percentage of patients for whom physician acts as gatekeeper Change in severity or complexity of patients' conditions for which care is provided without referral to specialists Appropriateness Change in number of referrals made
Non-PCPs	Changes in complexity or severity of patients' conditions at time of referral Appropriateness Change in number of referrals received

TABLE 2.1

CONTENTS OF THE PHYSICIAN SURVEY
(Continued)

Topic	Description
Practice Styles of Primary Care Physicians (Questionnaire Section E)	
PCPs	Clinical descriptions of patient histories for which physician is asked to state the percentage for whom s/he would recommend the course of action specified in the vignette.
Ability to Provide Care / Ability to Obtain Needed Services for Patients / Acceptance of New Patients with Various Types of Insurance (Questionnaire Section F)	
Level of agreement with statements regarding:	Having adequate time with patients Freedom to make clinical decisions Ability to provide high-quality care Level of communications with specialists/primary care physicians Ability to maintain continuing relationships with patients Ability to obtain a variety of specified services for patients Acceptance of new patients insured by Medicare, Medicaid, private insurance
Practice Revenue (Questionnaire Section G)	
Percentage of practice revenue from:	Medicare Medicaid Managed care, paid on a capitated or other prepaid basis Largest managed care contract Largest contract that is capitated or prepaid
Managed care contracts	Number of managed care contracts
Physician Compensation (Questionnaire Section H)	
Physician compensation	Whether physician is salaried Physician eligible to earn bonus or incentive income Factors used by practice to determine compensation
1995 income	Percentage of 1995 income earned in the form of bonuses, returned withholds, or other incentive payments Amount of income in 1995

Chapter 3

Deriving Appropriate Variance Estimates

Some element of uncertainty is always associated with sample-based estimates of population characteristics because the estimates are not based on the full population. This sampling error is generally measured in terms of the standard error of estimate, or its sampling variance,¹ which is an indicator of the precision of an estimate. Estimates of the standard errors are necessary to construct confidence intervals around estimates and to conduct hypothesis tests.

Like many other large national surveys, the sample design for the CTS Physician Survey uses stratification, clustering, and oversampling. Specialized techniques are therefore required for estimating sampling variances when the CTS data are used. This chapter explains how to estimate standard errors that account for the sample design. We discuss why standard errors resulting from commonly used statistical software packages should not be used to make estimates from this survey. Because the Public Use File does not provide enough information to allow the use of specialized statistical software designed to estimate variances for survey data estimates, we provide standard error look-up tables and formulas to approximate standard errors (see Appendix D). These tables and formulas can be used to obtain, for some types of estimates, approximate standard errors that account for the survey design.

3.1. The Limitation of Standard Statistical Software

Standard statistical packages, such as SAS and SPSS, compute variances using formulas that are based on the assumption that the data are from a simple random sample taken from an infinite population.² Although the simple random sample variance may approximate the sampling variance in some surveys, it is likely to substantially underestimate the sampling variance in a survey with a design like that of the CTS. For the CTS, the sampling variance estimate is a

¹The sampling variance, which is the square of the standard error, is a measure of the variation of an estimator attributable to having sampled a portion of the full population of interest using a specific probability-based sampling design. The classical population variance is a measure of the variation among the population, whereas a sampling variance is a measure of the variation of the *estimate* of a population parameter (for example, a population mean or proportion) over repeated samples. The population variance is different from the sampling variance in the sense that the population variance is a constant, independent of any sampling issues, whereas the sampling variance becomes smaller as the sample size increases. The sampling variance is zero when the full population is observed, as in a census.

²In the near future, both SAS and SPSS plan to include features that will account for survey sample designs.

function of the sampling design and the population parameter being estimated; it is called the “design-based sampling variance.”

Departures from a simple random sample design result in a “design effect” (*Deff*), which is defined as the ratio of the sampling variance (*Var*) given the actual survey design to the sampling variance of a hypothetical simple random sample (*SRS*) with the same number of observations. Thus:

$$Deff = \frac{Var(\text{actual design with } n \text{ cases})}{Var(\text{SRS with } n \text{ cases})}$$

A design effect equal to one means that the design did not increase or decrease the sampling variance relative to a simple random sample. A design effect of greater than one means that the design increased the sampling variance; that is, it caused the estimate to be less precise. A design effect of less than one means that the net effect of the sample design was to decrease the variance (i.e., to make the estimate more precise). The standard error of an estimate can be expressed as the standard error from a simple random sample with the same number of observations, multiplied by the square root of the design effect.

Over a representative set of CTS Physician Survey variables, the average design effect for physician-level national estimates using the combined sample is about 2.2. This means that the standard error is, on average, about 50 percent higher than it would have been had the same number of cases been selected using a simple random sample. The design effect of 2.2 also means that the precision of the CTS (with 12,528 observations) is equal to that of a simple random sample with a size of about 5,695. Note that the design effect is generally lower for subclasses of the population because there is less clustering of observations.

Because most of the variables in the CTS Physician Survey have a design effect greater than one, we present standard error look-up tables and formulas giving approximate standard errors that account for the survey design. The Physician Survey Restricted Use File is required to use specialized software (such as SUDAAN) to directly estimate standard errors that take into account the survey design.

3.2. Tables of Standard Errors and Design Effects

Tables D.1 through D.21 in Appendix D give approximate standard errors for various types of estimates and sample sizes. The standard error will vary depending on which variable is used and

on the physician subgroup upon which the estimate is based (if any). Appendix C explains how these standard errors were derived and what variables were used in the modeling process.³

These 21 tables are for national estimates: 9 are for percentage estimates and 12 are for mean estimates of “quasi-continuous” variables (defined below). Many tables are included for specific subgroups of physicians, defined as follows:

- All primary care physicians (PCPFLAG=1)
- All non-primary care physicians (PCPFLAG=0)
- Internal medicine physicians (SPECX=1)
- Family/general practice physicians (SPECX=2)
- Pediatricians (SPECX=3)
- Medical specialists, including psychiatrists (SPECX=4,6)
- Surgical specialists, including OB-GYNs (SPECX=5,7)
- Physicians in solo or two-person practice (PRCTYPE=1)
- Physicians in group practice (three or more) (PRCTYPE=2)
- Physicians in other practice settings (PRCTYPE=3,4,5,6)
- Physicians in practice with high revenue from managed care (above median of 35 percent) (PMC>35)
- Physicians in practice with low revenue from managed care (at or below median) (PMC<36)

For some types of estimates, we did not provide tables specific to certain of these subgroups, either because the model used to develop the table was not significant for that subgroup, or because the estimates for that subgroup were not different enough to merit their own table (see Appendix C). For example, for percentage estimates, there is no table specifically for physicians in a group practice (three or more physicians). For percentage estimates limited to such physicians (or a subset of such physicians), you should use the table for all physicians (Table D.1).

³As explained in Appendix C, certain estimates with too small a sample size, too high a relative standard error, or too small or too large a design effect were excluded from the regression models upon which these tables are based. Before using one of the tables, check to make sure that your particular estimate has a sufficient sample size (greater than 100).

Similarly, for mean estimates of quasi-continuous variables, there is no table for pediatricians. For quasi-continuous mean estimates limited to pediatricians (or a subset of pediatricians), you should use the table for all primary care physicians (PCPs) (Table D.2).

If you are interested in a subset of physicians not listed above, you can use the table for all physicians. If you are interested in a subset of one of the subgroups defined above, use the table associated with that subgroup (see example in the next section).

These subgroups refer to the *denominator* of your estimate, not the numerator. For example, if you are estimating the percentage of physicians who are PCPs, you would use the table for all physicians (Table D.1), not the table specific to PCPs (Table D.2).

3.2.1. National Percentage Estimates

Tables D.1 through D.9 give approximate standard errors for percentage estimates at the national level. These tables are to be used for categorical or ordinal variables. To use these tables, you must have produced percentage estimates using any standard statistical package and the appropriate weight variable. You can obtain standard error estimates from each table for percentages based on the population of physicians, or any subset of the population, represented in the table. If in your estimate you are subsetting to one of the 12 subgroups defined above (or any subset within that subgroup), use the table specific to that subgroup whenever provided.

For example, if you are making a percentage estimate based on only female physicians, you would use the table for “all physicians” because there is no table specifically for females. If you are making a percentage estimate based on female internists or internists in general, you would use the table for “all PCP physicians” because there is no table specifically for percentage estimates of internists. For female pediatricians or pediatricians in general, you would use the table for “general pediatricians.” Using the row associated with the unweighted sample size of the subset, you can obtain approximate standard errors for any weighted percentage estimates for that subset.⁴

Suppose you are interested in the national percentage of female PCP physicians who are board certified. We know that the unweighted number of female PCP physicians is 1,787 and that the estimated percentage (weighted) of female PCP physicians who are board certified nationally is about 83 percent. With this information in mind, you would go to the national table for PCP physicians (Table D.2) and find the row in which sample size is equal to 2,000 and the column in which the percentage is equal to 15 or 85 percent. The approximate standard error of this estimate would be 0.96 percent. Although the table is based on all PCP physicians, you can easily determine standard errors for a subset of PCP physicians (in this case, females) by using the row corresponding to the number of records for the PCP subset of interest.

⁴ If estimates are expressed in terms of proportions, rather than percentages, simply move the decimal place for the estimate and the standard error in the table two digits to the left.

3.2.2. National Mean Estimates of “Quasi-Continuous” Variables

While most of the variables on the file are categorical or ordinal, many correspond to responses expressed in terms of percentages; for example, PMCAID is the percentage of practice revenue from Medicaid. Because these responses are bounded by 0 and 100, we call the corresponding variables “quasi-continuous” and have produced standard error tables for their means separately from the means of other variables. Note that we are estimating a mean of a response that was expressed by each physician as a percentage; we are not estimating a percentage. Approximate standard errors for national estimates of these variables are found in Tables D.10 through D.21.

Quasi-continuous variables on the file are PPATMN, PCTGATE, PMCARE, PMCAID, PCAPREV, PMC, PBIGCON, PCTINCX, and the 12 Section E “vignette” variables representing percentages (variables beginning with the letter “V” and *not* ending with the letter “F”).

Tables D.10 through D.21 are used in the same manner as the tables for percentage estimates; that is, to use them, you must have produced mean estimates using any standard statistical package and the appropriate weight variable. From each table, you can obtain standard error estimates for means based on the population of physicians or on any subset of the population represented in the table. (Use appropriate subgroup-specific tables whenever provided.) Using the row associated with the unweighted sample size of the subset, you can obtain approximate standard errors for any weighted mean estimates for that subset.

Standard errors for means greater than 80 are not presented in the tables because the highest mean value among the variables and subgroups used for modeling was 63.4. The precision of the model-based prediction decreases for any estimates far outside the observed range.

3.2.3. National Mean Estimates of Continuous Variables

There are only six continuous variables on the Public Use File that are not identifiers, weights, sampling variables or reports of percentages (see description of “quasi-continuous” variables above). These variables are WKSWRKX, HRSMEDX, HRSPATX, HRFREEX, NPHYSX, and NASSISX.

Note that these six variables have undergone either top-coding or bottom-coding (see Chapter 4 for more details). Therefore, a mean based on these variables may be quite different from the mean that would be calculated using the unmasked version of the variable (available only on the Restricted Use File). Instead, you should consider collapsing these continuous variables into categories and then calculating distributional estimates (percentages falling within each of the categories).

3.2.4. Additional Information on Using Standard Error Tables

If you are interested in analyzing a physician subgroup that is defined by crossing the characteristics specifically represented in the subgroup tables (for example, PCPs in a practice with low revenue from managed care, or solo practice pediatricians), you should choose the table

specific to one of the defining characteristics and then use the row associated with the sample size defined by the other characteristic.

Because the models for subgroups defined by PCP/non-PCP (PCPFLAG), practice setting (PRCTYPE), and level of revenue from managed care (PMC) were roughly comparable in terms of their predictive ability, it will not matter much which of the two (or three) appropriate subgroup tables you choose. For example, for PCPs in a practice with low revenue from managed care, you can either look at the “all PCPs” table and use the row associated with the sample size of those in a practice with low revenue from managed care, or you can look at the “low revenue from managed care” table and use the row associated with the sample size of those who are PCPs.

However, the models based on specific specialty (defined by SPECX) were not as strong, so we suggest that you use tables specific to other characteristics if you are crossing specific specialty with other table-defined characteristics. For example, for solo practice pediatricians, look at the “solo or two-person practice” table and use the row associated with the sample size of those who are pediatricians, not the other way around.

Note that, because design effects vary by variable and population subgroup, these tables do not provide optimal estimates of standard errors. Furthermore, they cannot be used for other kinds of estimates, such as regression coefficients, ratios, and weighted totals. To obtain standard errors for such estimates, you would need to use the Restricted Use File and specialized software.

Chapter 4

Variable Construction and Editing

The CTS Physician Survey Public Use File contains three types of variables: unedited variables, edited variables, and constructed variables created from edited or unedited variables.¹ This chapter provides a general description of the types of constructed and edited variables in the file, as well as additional details on selected variables.

The information in this chapter supplements the information provided in the “Description” field of the file’s codebook. Users are encouraged to review this information along with the annotated questionnaire and flowcharts provided in Appendix A and Appendix B of this manual for a better understanding of the questionnaire structure, skip patterns, and other characteristics of the variables reported on the file.

4.1. Edited Variables

The CTS Physician Survey data were collected via computer-assisted telephone interviewing (CATI). The CATI editing functions included consistency checks and editing of some skip patterns and outlier values. This section describes the editing that followed the CATI data collection, including logical editing, imputation of missing values, and editing for confidentiality. Verbatim text responses were also reviewed and coded.

4.1.1. Logical Editing

Logical editing was performed to resolve inconsistencies among related variables and to resolve skip pattern inconsistencies. For example, question A6 (YRBGNX), pertaining to the year the physician began practicing medicine, was asked of all physicians. There were cases where the reported year in which the physician began to practice was before his/her reported year of medical school graduation. In these cases, the value for YRBGNX was changed to make it three years later than the graduation year (for primary care physicians) or five years later than the graduation year (for specialists). (As described below, after the aforementioned edits, YRBGNX and GRADYRX were recoded into five-year intervals for confidentiality reasons).

Another type of logical edit occurred when a question that should have been asked according to the skip logic was not asked. For example, when a respondent said “-8:Don’t Know” to physician vignette question E9 (V60MAN, For what percentage of such patients would you recommend a PSA test?), the follow-up question E9a (V60MANF, Would you recommend a PSA test rarely, sometimes, ...?) should have been asked. If for some reason question E9a was not asked in this

¹In general, unedited variables are those that contain the original response to a single questionnaire item.

situation (that is, if it had been coded as “-1: Inapplicable”), the response was recoded to “-9:Not Ascertained.” Logical editing also included review and resolution of inconsistencies after data imputation was performed.

4.1.2. Imputation of Missing Values

Missing values for selected variables were imputed using unweighted and weighted sequential hot-deck imputation.² Variables were selected for imputation according to their level of missing data and analytic importance. Table 4.1 lists the variables selected for imputation.

Most variables had few incidences of missing values (under 3 percent). The only exceptions are income (INCOMEX) and several variables from Section G: Practice Revenue that had nonresponse rates as high as 15 percent. The Section G variables are: percent managed care (PMC), number of managed care contracts (NMCCONX), percent of revenue from Medicare (PMCARE) and Medicaid (PMCAID), percent of revenue from largest managed care contract (PBIGCON), and percent of revenue paid on prepaid or capitated basis (PCAPREV). The continuous income variable had the highest nonresponse rate at 16 percent, but we incorporated categorical responses for income into the imputation, allowing for more precise imputation. An imputation flag is included for most variables with imputed values. A value of “1 Imputation” for the imputation flag indicates that the value of the corresponding variable was imputed. For confidentiality reasons, imputation flags were not included for variables that were masked. The imputed variables without flags are:

- Weeks practicing medicine in 1995 (WKSWRKX)
- Hours in the previous week devoted to medical activities (HRSMEDX)
- Hours in the previous week devoted to patient activities (HRSPATX)
- Hours in the previous month devoted to charity care (HRFREEEX)
- Number of physicians in practice (NPHYSX)
- Number of assistants in practice (NASSISX)

²In sequential hot-deck imputation, persons with missing values, or “recipients,” are linked to persons with available values, or “donors,” to fill in the missing data. The donors and recipients are first classified into strata and then sorted within each strata using classification/sort variables such as age, gender, and education. (The number of strata is limited by a minimum donor-to-recipient ratio that must be satisfied within each stratum.) Donors are then assigned to recipients with similar characteristics within their stratum. In weighted hot-decking, donor and recipient weights are used to help determine the assignment of donors to recipients so that means and proportions calculated using the imputed data will equal means and proportions obtained using only donor data. In general, weighted hot-decking was performed for data with more than 5 percent missing values.

TABLE 4.1
VARIABLES SELECTED FOR IMPUTATION

Description	Variable Name
Section A:	
Multiple practice	MULTPR
Section B:	
Weeks worked	WKSWRKX
Hours worked in medical activities, patient care, and charity	HRSMEDX, HRSPATX, HRFREEX
Section C:	
Acquired practice	ACQUIRD
Ownership status	OWNPR
Number of physicians and assistants	NPHYSX, NASSISX
Section D:	
Percent of patients for whom physician is a gatekeeper	PCTGATE
Section F:	
Accepting Medicare patients	NWMCARE
Accepting Medicaid patients	NWMCAID
Accepting privately insured patients	NWPRIV
Section G:	
Percent Medicare patients	PMCARE
Percent Medicaid patients	PMCAID
Percent capitated revenue	PCAPREV
Number of managed care contracts	NMCCONX
Largest contract paid on capitated basis	CAPAMTC
Percent of practice revenue from managed care	PMC
Percent of practice revenue from largest managed care contract	PBIGCON
Section H:	
Risk adjustment of profiles	RADJ
Percent income from bonuses	PCTINCX
Income	INCOMEX

- Number of managed care contracts (NMCCONX)
- Net income in 1995 (INCOMEX)
- Percent income from bonuses (PCTINCX)

4.1.3. Editing for Confidentiality

Some data in the Public Use File have been manipulated or edited to ensure the confidentiality of survey respondents while maximizing the scope of data released to the public. This type of editing consisted of such steps as excluding variables and constructing new variables based on original ones. All cases of editing for confidentiality are described in the file's codebook in either the "Format" field or the "Description" field. Variables subjected to confidentiality editing have been assigned names ending with "X."

4.1.3.1. Variable Exclusion

All geographic information has been removed from the Physician Public Use File. In addition, we excluded any variables that could serve to identify an individual physician. Examples include: the type of doctor--MD or Osteopath--and the country from where the physician graduated medical school. Survey questions or constructed variables that had very small cell sizes were also excluded because these variables may uniquely describe individual physicians. Finally, we excluded all sample design parameters and weights except for one weight to be used for making national estimates. This was done because the sample design parameters describe geographic information and the other weights are for site-specific purposes. Standard error tables are included in Appendix D and described in Chapter 3. These will allow researchers to approximate standard errors that take the sampling design into account.

4.1.3.2. Masking of Minimum and Maximum Values

Extreme and relatively rare cases that fell at the top or bottom of a distribution were recoded to a lower/higher value, which is referred to as "top-" or "bottom-coding" in the Format and Description fields in the codebook. For example, the variable corresponding to question B1 (WKSWRKX, number of weeks practicing medicine in 1995) reflects the use of bottom-coding. Reported values less than 40 have been combined into a single category, "40 (bottom code)." Six of the continuous analytic variables on the Public Use file have undergone either top-coding or bottom-coding. This truncation of values will affect mean estimates computed from these variables. (See Section 3.2.3).

4.1.3.3. Constructing New Variables

For confidentiality reasons, new variables were constructed by combining several original variables, by collapsing values of a categorical variable, or by collapsing values for a continuous

variable into categories. When survey questions identified relatively rare populations, a new variable was constructed by combining the rare cases into one or more broad groups. For a single categorical variable, one or more values were combined.

For example, SPECX, which describes the physician's specialty, was constructed by combining the responses to questions A8 (physician's specialty) and A10 (physician's subspecialty). Responses to A8 and A10 included over 200 possible values. These specialties were collapsed into seven categories of specialty in SPECX.

Another example of a newly constructed variable that combines survey responses into categories is YRBGNX, the year the physician began medical practice. Question A6 asks for the actual year the physician began practice. We recoded the year values into five-year intervals and recoded those who began practice after 1994 as 1994 (top-coding).

Similarly, the variable TOPEMPX (type of physician employment), which corresponds to question C3, was constructed by combining categories of solo practice and two-physician practice into category 6, "2 phys & solo practice." Group model HMO and Staff model HMO were combined into category 9, "Grp model & Staff model HMO."

4.1.4. Editing Verbatim Responses

For several questionnaire items, respondents were allowed to provide verbatim responses when none of the existing response categories seemed to apply. The verbatim responses themselves are excluded from the Public Use File. They were, however, reviewed and many were coded into an existing or a new categorical value. If the verbatim was not so coded, the physician's response was recorded as "1: Other."

4.2. Constructed Variables

Constructed variables include the following:

- Weight - WTPHY4
- Other variables constructed for analytical value. These range from relatively straightforward variables that combine one or more original question items for the convenience of analysts (e.g., BDCERT, the certification or eligibility status of a physician that was constructed from four survey questions: A11, A13, A15, and A17) to more complex variables such as PMC, percent managed care revenue (and the other practice revenue variables from Section G of the survey), that is constructed from survey questions G6 through G11 and is then edited for consistency with the other practice revenue variables in the survey.

Constructed variables are indicated in the file's codebook by a value of "N/A" (Not Applicable) in the Question field. Information on how they were constructed appears in the Description field. Table 4.2 contains additional background on some of the more complex constructions.

4.3. Identification, Geographic, and Frame Variables

Not all variables on the Public Use File were obtained directly from survey respondents via the CATI questions. Additional variables include the physician identifier and other survey administration variables relating to demographic information from the sample frame.

The physician identifier variable on the Public Use File is called PHYSIDX.

The American Medical Association (AMA) and the American Osteopathic Association (AOA) provided some demographic information when they formed the sample frame. This information includes: IMGUSPR (foreign medical school graduate), GRADYRX (year graduated from medical school), GENDER, and BIRTHX.

4.4. Additional Details on Selected Survey Variables

Table 4.2, organized by questionnaire section, provides helpful hints about variables (singly or in sets), discusses a variable's relationship with other variables, and suggests when to use a specific variable. This information supplements the variable-specific details contained in the file's codebook.

TABLE 4.2

ADDITIONAL INFORMATION ON SURVEY QUESTIONS
(by Questionnaire Section)

Variable	Additional Information
Section A Variables: Introduction	
YRBGNX	<p>Question A6 asks for the year that the physician began medical practice.</p> <p>Examination of certain responses to this question indicates that some respondents replied with the number of years in practice rather than the actual year commencing practice. For these cases, YRBGNX was set to the Interview year minus the number of years in practice (initial response to YRBGNX).</p> <p>For physicians who did not respond to this question or for whom his/her medical school graduation year occurred after the reported value for YRBGNX, YRBGNX was reset to graduation year + 3 for primary care physicians and graduation year + 5 for specialists. If graduation year was also missing, then YRBGNX was set to be BIRTH + 30 for primary care physicians and BIRTH + 32 for specialists. YRBGNX was converted to a 4-digit year by adding 1900 to the value for YRBGNX.</p>
PCPFLAG	<p>PCPFLAG is a constructed flag variable that indicates whether the physician is a primary care physician (PCPFLAG=1) or a specialist (PCPFLAG=0). The variable is constructed based on responses to questions A8, A10, A9, A9a, and A9b.</p> <p>PCPFLAG=1 if the physician's specialty (A8 or A10) is one of the following: Family practice (019) Geriatric medicine (020,043) General practice (023) Adolescent medicine (085, 133)</p> <p>OR if the physician's specialty (A8 or A10) is one of the following: Internal Medicine (042) Pediatrics (088) Internal Med-Pediatrics (137) AND the physician spends most of his/her time in this specialty (i.e., A9=1)</p> <p>OR if the physician is an adult specialist and spends more time practicing general internal medicine than his/her subspecialty (A9a=2 or 3)</p> <p>OR if the physician is a pediatric specialist and spends more time practicing general pediatrics than his/her subspecialty (A9b=2 or 3)</p> <p>PCPFLAG is the survey definition for primary care physician.</p>

Section B Variables: Utilization of Time					
HRSMEDX	<p>HRSMEDX is a constructed variable that defines the number of hours (during the past week) spent in medically related activities. This question could be asked up to three times in three different ways by the CATI system, checking for data consistency each time. HRSMEDX is constructed from responses to survey questions B2, B3c, and B4.</p> <p>If HRSPATX (the number of hours spent in direct patient activities) was greater than HRSMEDX, then HRSMEDX was imputed.</p>				
HRSPATX	<p>HRSPATX is a constructed variable that defines the number of hours (during the past week) spent in direct patient care activities. This question could be asked up to three times in three different ways by the CATI system, checking for data consistency each time. HRSPATX is constructed from responses to survey questions B3, B3d, and B5.</p> <p>If HRSPATX was greater than HRSMEDX (after imputation of both variables) then HRSPATX was set equal to HRSMEDX.</p>				

TABLE 4.2 (continued)
 ADDITIONAL INFORMATION ON SURVEY QUESTIONS
 (by Questionnaire Section)

Variable	Additional Information
Section C Variables: Type and Size of Practice	
TOPOWNX	<p>TOPOWNX is a constructed variable that is a corrected version of survey variable C2-type of ownership. TOPOWNX is “corrected” or edited by incorporating the response to question C9. If the physician indicated (from the response to question C9) that he/she works in a practice that is a group model HMO, then TOPOWNX was set equal to “9: Group/staff model HMO.”</p>
TOPEMPX	<p>TOPEMPX is a constructed variable that combines information from several questions about physician type of employment into one variable. TOPEMPX combines the responses to questions C3 and C3b, and C9. Questions C3 and C3b ask about the type of employer for which the physician works. Question C3b includes edits based on verbatim responses. If the physician indicated (from the response to question C9) that he/she works in a practice that is a group model HMO, then TOPEMPX was set equal to “9: Group/staff model HMO.” The following values for TOPEMPX were recoded to “1: Other”:</p> <ul style="list-style-type: none"> 1: Other 11: Other insurance 14: City, county, state government 15: Integrated health 16: Freestanding clinic 17: Physician practice management 18: Community health center 19: Management services organization (MSO) 20: Physician hospital organization (PHO) 21: Locum tenens

TABLE 4.2 (continued)
 ADDITIONAL INFORMATION ON SURVEY QUESTIONS
 (by Questionnaire Section)

Variable	Additional Information												
PRCTYPE	<p>PRCTYPE is a constructed variable that summarizes the type of practice in which the physician works. It combines information about ownership and employment and is constructed as follows:</p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top;">1: Solo/two physician practice</td> <td style="width: 50%; vertical-align: top;">TOPOWNX=solo or two-physician practice OR TOPEMPX=solo or two-physician practice</td> </tr> <tr> <td style="vertical-align: top;">2: Group>=three physicians</td> <td style="vertical-align: top;">TOPOWNX=three or more physicians OR TOPEMPX=three or more physicians</td> </tr> <tr> <td style="vertical-align: top;">3: HMO</td> <td style="vertical-align: top;">TOPOWNX=Group model HMO or staff Model HMO OR TOPEMPX=Group model HMO or staff Model HMO</td> </tr> <tr> <td style="vertical-align: top;">4: Medical school</td> <td style="vertical-align: top;">TOPEMPX=Medical school or university</td> </tr> <tr> <td style="vertical-align: top;">5: Hospital based</td> <td style="vertical-align: top;">TOPEMPX=Nongovernment hospital OR TOPEMPX=City, county, state govt AND C3a=hospital</td> </tr> <tr> <td style="vertical-align: top;">6: Other</td> <td style="vertical-align: top;">All other responses</td> </tr> </table> <p>Note that all physicians who work for a state or local government hospital are classified as “Hospital Based” in PRCTYPE but as “Other” in TOPEMPX.</p>	1: Solo/two physician practice	TOPOWNX=solo or two-physician practice OR TOPEMPX=solo or two-physician practice	2: Group>=three physicians	TOPOWNX=three or more physicians OR TOPEMPX=three or more physicians	3: HMO	TOPOWNX=Group model HMO or staff Model HMO OR TOPEMPX=Group model HMO or staff Model HMO	4: Medical school	TOPEMPX=Medical school or university	5: Hospital based	TOPEMPX=Nongovernment hospital OR TOPEMPX=City, county, state govt AND C3a=hospital	6: Other	All other responses
1: Solo/two physician practice	TOPOWNX=solo or two-physician practice OR TOPEMPX=solo or two-physician practice												
2: Group>=three physicians	TOPOWNX=three or more physicians OR TOPEMPX=three or more physicians												
3: HMO	TOPOWNX=Group model HMO or staff Model HMO OR TOPEMPX=Group model HMO or staff Model HMO												
4: Medical school	TOPEMPX=Medical school or university												
5: Hospital based	TOPEMPX=Nongovernment hospital OR TOPEMPX=City, county, state govt AND C3a=hospital												
6: Other	All other responses												
Section E Variables: Vignettes													
VCHOL, VCHOLF through VECZEM, VECZEMF	<p>The vignette questions were asked of primary care physicians. A small error in the CATI skip logic resulted in some physicians (those who specified that they were primary care physicians through question SUBSPC [A10]) not being asked these questions. The first six questions (VCHOL, VHYPER, VCHEST, VBACK, V60MAN, VVITCH) are questions geared toward treating adults. The last six questions (VENUR, VTHRT, VCOUGH, VSUPOT, V6FEVR, VECZEM) are questions geared toward treating children. If a physician treats adults only, he/she was asked the first six questions. If a physician is a pediatrician or a general primary care physician who treats only children, then he/she was asked the last six questions. If the physician treats both adults and children, then he/she was asked six questions--three adult vignette questions and three child vignette questions--that were chosen randomly from each group of six questions.</p> <p>The expected response to each vignette question is a percentage (For what percentage of your patients would you recommend...?). If the physician responded “-8: Don’t Know” to the vignette question, he/she was then asked a follow-up question that categorized the response into general categories (6: Always, 5: Almost always, 4: Frequently, 3: Sometimes, 2: Rarely, or 1: Never). All of the follow-up question variable names end in “F.”</p>												

TABLE 4.2 (continued)
 ADDITIONAL INFORMATION ON SURVEY QUESTIONS
 (by Questionnaire Section)

Variable	Additional Information
Section G Variables: Practice Revenue	
PCAPREV	<p>PCAPREV is a constructed variable indicating the percent of the practice's total patient care revenue paid on a capitated or other prepaid basis. PCAPREV is constructed from responses to: G3, G8c, and G8g (questions that asked about percentage of practice revenue paid on a capitated or other prepaid basis). Post imputation edits were performed on this variable as follows:</p> <p>a. Capitated revenue is a subset of managed care revenue. Therefore, if PCAPREV>PMC (percent managed care revenue) and both PCAPREV and PMC were imputed, then PCAPREV was edited to be equal to PMC.</p> <p>b. If there is only one managed care contract and all managed care revenue is capitated revenue, then the capitated revenue must be equal to all managed care revenue. Therefore, if NMCCONX (number of managed care contracts)=1</p> <p style="text-align: center;">AND</p> <p>PMC=PBIGCON (i.e., percent managed care revenue=percent revenue from largest man care contract)</p> <p style="text-align: center;">AND</p> <p>CAPAMTC (amount of capitated revenue)="4, All"</p> <p style="text-align: center;">AND</p> <p>PCAPREV was imputed</p> <p>then PCAPREV was edited to be equal to PMC.</p>
PMC	<p>PMC is a constructed variable indicating the percentage of the practice's total patient care revenue obtained from managed care. PMC is constructed from responses to: G7, G8, G8b, G8f, G9a, and G9d (questions that asked about percentage of practice's revenue that comes from managed care). Capitated revenue is a subset of managed care revenue. Therefore, this variable was edited in the following way:</p> <p>a. If PCAPREV (percent capitated revenue)>PMC , then PMC was edited to be equal to PCAPREV.</p> <p>In addition, a post-imputation edit was performed:</p> <p>b. If PCAPREV>PMC AND PMC was imputed, but PCAPREV was not imputed, then PMC was edited to be equal to PCAPREV.</p>

TABLE 4.2 (continued)
 ADDITIONAL INFORMATION ON SURVEY QUESTIONS
 (by Questionnaire Section)

Variable	Additional Information
PBIGCON	<p>PBIGCON is a constructed variable that is the percentage of the practice revenue obtained from the practice's largest managed care contract. PBIGCON is constructed from responses to: G9, G9b, and G9e (questions that asked about the percentage of practice revenue coming from the largest managed care contract). PBIGCON was edited for consistency as follows:</p> <ul style="list-style-type: none"> a. If NMCCONX (number of managed care contracts)=0, then PBIGCON was set equal to -1: Inapplicable. If there are no managed care contracts, then the questions asking about practice revenue from the largest contract are not applicable. b. If PMC (percent managed care revenue)=0, then PBIGCON was set equal to: -1: Inapplicable. If there is no managed care, then the questions asking about practice revenue from the largest contract are not applicable. c. If PMC>0 AND NMCCONX=1, then PBIGCON was set equal to PMC. If there is managed care revenue coming from one contract only, then the practice revenue coming from the largest contract is equal to all of the managed care revenue for the practice. d. If PMC>0 AND PBIGCON=0 then PBIGCON was imputed. If the physician indicated that there was managed care revenue, but there was no revenue coming from the largest contract, then we imputed the value for PBIGCON. e. If PMC>0 AND NMCCONX>0 AND PBIGCON=-1: Inapplicable, then PBIGCON was imputed. If there is managed care revenue, and at least one managed care contract, and the physician's responses to the PBIGCON questions were logically skipped, then we imputed the value for PBIGCON. f. If PMC=0 AND NMCCONX>0 AND PBIGCON=-1: Inapplicable, then PBIGCON was set equal to 0. If there is at least one managed care contract, but no managed care revenue, and the physician's responses to the PBIGCON questions were logically skipped, then the percentage of revenue coming from the largest managed care contract is 0 (even though there are contracts, there is no revenue associated with them). <p>In addition, a post-imputation edit was performed:</p> <ul style="list-style-type: none"> g. If PMC<PBIGCON and PBIGCON was imputed, then PBIGCON was set equal to PMC. If the percentage of practice revenue coming from the largest contract is greater than the total amount of managed care revenue from the contract (as a result of imputing PBIGCON), then the revenue from the largest contract is set equal to all of the managed care revenue.

TABLE 4.2 (continued)
 ADDITIONAL INFORMATION ON SURVEY QUESTIONS
 (by Questionnaire Section)

Variable	Additional Information
CAPAMTC	<p>CAPAMTC is a constructed variable that is an edited version of question G11 (how much of practice revenue from the largest managed care contract is paid on a capitated or prepaid basis?). It was edited from the original value as follows:</p> <ul style="list-style-type: none"> a. If there is no managed care revenue or if there are no managed care contracts, then CAPAMTC=-1: Inapplicable. b. If there is managed care revenue and the physician indicates that all of it is capitated (from question G8d or PMC=PCAPREV), then CAPAMTC=4: All. c. If there is managed care revenue (PMC>0), but no capitated revenue (PCAPREV=0), then CAPAMTC=1: None. d. If there is one managed care contract (NMCCONX=1) and all of the managed care revenue comes from that one contract and this revenue is all capitated revenue (PCAPREV=PBIGCON=PMC), then CAPAMTC=4: All.
Section H Variables: Physician Compensation Methods & Income Level	
PCTINCX	<p>PCTINCX is a constructed variable that is an edited version of question H9 (percent of 1995 income coming from bonuses). It is edited as follows:</p> <p style="padding-left: 40px;">Physicians who responded "0: No" to H9a (EBONUS-eligible for bonuses in 1995) are assigned a value of -1: Inapplicable.</p>

Chapter 5

File Details

This chapter provides an overview of the file content and technical specifications for programmers. It also describes the variable naming and coding conventions that were used on the file and that appear in the file's codebook.

5.1. File Content and Technical Specifications

The CTS Public Use File contains 12,528 person records. The unique record identifier and sort key is the variable PHYSIDX. Variables are positioned on the file in the following order:

- Survey administration variables: this group includes identifiers and other variables associated with conducting the survey
- Variables from Sections A-H of the Physician Survey questionnaire: Variables are ordered within each section by related questionnaire item number
- Weight variable

The Public Use File is provided as an ASCII-formatted file with the following technical specifications:

File name:	CTSR1PP1.TXT
Number of observations:	12,528
Number of variables:	120
Logical record length:	272 bytes

The file contains a two-byte carriage return/line feed at the end of each record. When you are converting to a PC-SAS file, use the LRECL option to specify the record length to avoid the default PC-SAS record length. If the RECFM=V option is used, the LRECL option must be specified as the logical record length (272). If RECFM=F is used, the LRECL value must be specified as the logical record length plus two (274). Note that if the RECFM option is omitted, then the default option of RECFM=V will be used, and LRECL must be specified as the logical record length (272). When you are converting to an SPSS file, use the "FIXED" option of the DATA LIST command, and read values according to column location specified by the column position after each variable name.

The record layout for this file is provided in the file's codebook.

5.2. Variable Naming Conventions

In general, a variable name reflects the content of the variable. Names were limited to seven characters so that additional indicators could be used in subsequent Public Use File releases. For the following groups of variables, a naming convention was used to provide additional information on variable content:

- **Imputation Flags.** These flags indicate whether a record has an imputed value for the corresponding variable. The flag variable has the same name as the variable it describes, and includes the prefix “_”. When reading the data into SPSS, imputation flags contain the prefix “T” because SPSS does not recognize the “_” character. For example, _PMC (or IPMC) is the imputation flag corresponding to the variable PMC. Refer to Chapter 4 for more information on imputation and other types of editing procedures used on the file.
- **Weight.** The prefix “WT” is used for the weight variable name.
- **Masked Variables.** Names of variables that were masked for confidentiality reasons end with the value “X.” The variable descriptions contained in the file’s codebook indicate whether the variable was masked and provide brief details as to the type of masking performed.

A copy of the data collection instrument annotated with the names of those variables that directly correspond to a single question is provided in Appendix A.

5.3. Variable Coding Conventions

The following coding conventions are used on the file:

- | | |
|--------------------|--|
| -1 Inapplicable | Question was not asked because of skip pattern. |
| -7 Refused | Question was asked and respondent refused to answer. |
| -8 Don’t Know | Question was asked and respondent did not know the answer. |
| -9 Not Ascertained | Value was not assigned for any other reason. |

Hello, Dr. (name from fone file) my name is _____ from The Gallup Organization. A short time ago, you should have received a letter from the Robert Wood Johnson Foundation indicating that Gallup is conducting a national survey of physicians for the Foundation. The survey is part of a study of changes in the health care system in communities across the nation. It concerns how such changes are affecting physicians, their practices and the health care they provide to their patients.

The interview will take about 20-25 minutes and we are providing an honorarium of \$25 as a small token of our appreciation to each physician who completes an interview. All the information you provide will be kept strictly confidential. It will be used in statistical analysis and reported only as group totals. I can conduct the interview now or at any time that*s convenient for you.

- 1 Available - (Skip to #A1)
 - 2 Not available - (Set time to call back)
 - 3 No longer works/lives here - (Skip to S8)
 - 4 Never heard of respondent - (Continue)
 - 5 Non-respondent hard refusal - (Skip to S13)
 - 6 Physician soft refusal - (Skip to S13)
 - 7 Physician hard refusal - (Skip to S13)
 - 8 Answering service/
Can't ever reach physician at this number - (Skip to S11)
 - 9 Other - (Skip to S13) _____(512)
-

S7. (If code "4" in "INTRO", ask:) I would like to verify that I have reached (phone number from fone file).

- 1 Yes - (Thank and Terminate; Skip to S11)
- 2 No -
(READ:) I am sorry to have bothered you. - (Reset to "INTRO")
- 3 (DK) (Thank and Terminate; Skip to S11)
- 4 (Refused) (Thank and Terminate; Skip to S11) _____(918)

S8. (If code "3" in "INTRO", ask:) Dr. (response in S2) is a very important part of a medical study for the Robert Wood Johnson Foundation. Do you have the address or telephone number where I can reach (him/her)?

1 Yes - **(Skip to S10)**

2 No/Unknown **(Continue)**

3 (DK) **(Continue)**

4 (Refused) **(Continue)**

5 (Retired) _____(919)

S9. (If code "2-4" in S8, ask:) Do you happen to know if the doctor is still in this area, or is (he/she) in another city?

1 Same area - **(Thank and Terminate; Skip to S11)**

2 Different city - **(Continue)**

3 (DK) **(Thank and Terminate; Skip to S11)**

4 (Refused) **(Thank and Terminate; Skip to S11)** _____(920)

S10. (If code "2" in S9 OR If code "1" in S8:) ENTER PHONE NUMBER AND ADDRESS OR AS MUCH OF IT AS POSSIBLE.

WORK PHONE NUMBER: _____ (921 - 930)

HOME PHONE NUMBER: _____ (941 - 950)

STREET ADDRESS: _____ (1512-1551)

CITY: _____ (1131-1160)

STATE: _____ (931) (932)

ZIP CODE: _____ (933 - 937)

(All in S10, Thank and Terminate;
Call new number and reset to "INTRO";
If "blank" in "WORK PHONE NUMBER" and
"HOME PHONE NUMBER" in S10, Continue)

S11. (If code "1", "3" or "4" in S7 OR If code "8" in "INTRO" OR If code "1", "3" or "4" in S9 OR If "blank" in "WORK PHONE NUMBER" and "HOME PHONE NUMBER" in S10:) (Call directory assistance for most recent city or area code. Ask for directory assistance using full name from fone file.)

(Original phone number from fone file)

(Original city from fone file) or ("CITY" from S10)

(New city; New street address)

(Name from fone file)

1 New number - (Enter on next screen)

2 No number/match - (Thank and Terminate; Save Case ID)_____(1161)

S12 NEW PHONE NUMBER: (FORCE 10 DIGITS)

(1162-1171)

(All in S12, call new number and reset to "INTRO")

S13. VERBATIM SCREEN: Describe what happened on this call in as much detail as possible.

(1172)(1173)

A1. Are you currently a full-time employee of a federal agency such as the U.S. Public Health Service, Veterans Administration or a military service? **(Probe:)** Do you receive your paychecks from a federal agency?

1 Yes - (Continue)

2 No - (Skip to #A2)

8 (DK) (Thank and Terminate)

9 (Refused) (Thank and Terminate) _____(513)

(If code "1" in #A1, read:) In this survey, we will not be interviewing physicians who are Federal employees. So it appears that we do not need any further information from you at this time, but we thank you for your cooperation. - (Thank and Terminate)

A2. Are you currently a resident or fellow?

1 Yes - (Continue)

2 No - (Skip to #A3)

8 (DK) (Thank and Terminate)

9 (Refused) (Thank and Terminate) _____(514)

(If code "1" in #A2, read:) In this survey, we will not be interviewing physicians who are residents or fellows. So it appears that we do not need any further information from you at this time, but we thank you for your cooperation. - (Thank and Terminate)

A3. During a TYPICAL week, do you provide direct patient care for at least 20 hours a week? **(If necessary, read:)** Direct patient care includes seeing patients and performing surgery. **(If necessary, read:)** INCLUDE time spent on patient record-keeping, patient-related office work, and travel time connected with seeing patients. EXCLUDE time spent in training, teaching, or research, any hours on-call when not actually working, and travel between home and work at the beginning and end of the work day.

1 Yes - (Skip to #A4)

2 No - (Continue)

8 (DK) (Thank and Terminate)

9 (Refused) (Thank and Terminate) _____(515)

(If code "2" in #A3, read:) In this survey, we will not be interviewing physicians who typically provide patient care for less than 20 hours a week. So it appears that we do not need any further information from you at this time, but we thank you for your cooperation. - (Thank and Terminate)

A4. Do you currently provide patient care in one practice, or more than one practice? (If necessary, read:) We consider multiple sites or offices associated with the same organization to be only one practice. (INTERVIEWER NOTE #1: Examples are: a private MD with a downtown and suburban office is one practice; a regional organization with member doctors practicing in numerous satellite clinics or offices is one practice; and multiple sites with DIFFERENT organizations are different practices.) (INTERVIEWER NOTE #2: Do not count non-patient-care activity, such as teaching or administrative jobs, as practices.)

MULTPR

- 1 One - (Skip to "Note" before #A5)
- 2 More than one - (Continue)
- 8 (DK) (Skip to "Note" before #A5)
- 9 (Refused) (Skip to "Note" before #A5) _____(516)

A4a. (If code "2" in #A4, ask:) In how many different practices do you provide patient care? (Open ended and code actual number)

NUMPRX

- DK (DK)
 - RF (Refused)
- _____ (517) _____ (518)

(If code "00" in "SITE", Skip to #A5a1; Otherwise, Continue)

A5. We'd like you to think about the practice location at which you spend the greatest amount of time in direct patient care. Is this practice located in (county and state from fone file)?(INTERVIEWER NOTE: Surgeons should give the location of their office, not the hospital where they perform surgery.)

- 1 Yes - (Skip to #A6)
- 2 No (Continue)
- 8 (DK) (Continue)
- 9 (Refused) (Continue) _____(1174)

A5a. (If code "2" or "8-9" in #A5, ask:) In what county and state is the practice located. (Open ended) (VERIFY SPELLING)

- DK (DK)
 - RF (Refused)
- COUNTY: _____ (1434-1458)
- STATE: _____ (1459)(1460)

A5a1 (If code "00" in "SITE", ask:) We'd like you to think about the practice location at which you spend the greatest amount of time in direct patient care. In what county and state is the practice located? (Open ended) (VERIFY SPELLING)

DK (DK)
RF (Refused)

COUNTY:

(1434-1458)

STATE:

(1459)(1460)

A6. In what year did you begin medical practice after completing your undergraduate and graduate medical training? (INTERVIEWER NOTE: A residency or fellowship would be considered graduate medical training.) (Open ended and code last two digits of year)

YRBGNX

98 (DK)
99 (Refused)

(523) (524)

A7. We have your primary specialty listed as (response in "SPECIALTY"). Is this correct? (If necessary, read:) We define primary specialty as that in which the most hours are spent weekly.

1 Yes - (Autocode "SPECIALTY" in #A8)

2 No - (Continue)

8 (DK) (Thank and Terminate)

9 (Refused) (Thank and Terminate) _____ (525)

A8. (If code "2" in #A7, ask:) What is your primary specialty? (If necessary, read:) We define primary specialty as that in which the most hours are spent weekly. (Open ended and code from hard copy) (INTERVIEWER NOTE: Probe for codable response)

SECTION D
MEDICAL CARE MANAGEMENT

MANAGEMENT STRATEGIES

(READ:) Now I would like to ask you a series of questions about various medical care management techniques or strategies that are sometimes used to manage the care physicians provide to their patients. For each, I'll ask you how large an effect they have on your practice of medicine. The choices are: a very large effect, large, moderate, small, very small, or no effect at all. **(If code "2" or "8-9" in #A4, read:)** As you answer, please think only about your main practice.

D1. At present, **(read and rotate A-F)?** Would you say that (it has/they have) a **(read 5-0)?** **(If physician says "Do not use/receive", read:)** Does this mean (it has/they have) no effect?

- 5 Very large
- 4 Large
- 3 Moderate
- 2 Small
- 1 Very small
- 0 OR, no effect at all

- 8 (DK)
- 9 (Refused)

EFDATA

A. How large an effect does your use of computers to obtain or record clinical data, such as medical records and lab results, have on your practice of medicine **(INTERVIEWER NOTE: This could include the physician*s own computer system or that provided by a health insurance plan or HMO, hospital or other institution.)**
_____ (637)

EFTREAT

B. How large an effect does your use of computers to obtain information about treatment alternatives or recommended guidelines have on your practice of medicine **(INTERVIEWER NOTE: This could include the physician*s own computer system or that provided by a health insurance plan or HMO, hospital or other institution.)**
_____ (639)

D1. (Continued:)

EFRMNDR

- C. (If code "019-020", "023", "043", "062", "064-065", "085" or "133" in #A10/#A8, OR If code "1" in #A9, OR If code "2" or "3" in #A9a, OR If code "2" or "3" in #A9b, ask:) How large an effect do reminders that you receive from either a medical group, insurance company or HMO alerting you about specific preventive services that may be due for your individual patients have on your practice of medicine (INTERVIEWER NOTE: includes reminders from either the medical practice, insurance companies, clinics or HMOs. Does NOT include general educational material about preventive services or other reminders that are not about specific services for specific patients.)
- _____ (641)

EFGUIDE

- D. How large an effect does your use of FORMAL, WRITTEN practice guidelines such as those generated by physician organizations, insurance companies or HMOs, or government agencies have on your practice of medicine (INTERVIEWER NOTE: Exclude guidelines that are unique to the physician.) (If physician says that s/he uses his/her own guidelines, read:) In this question, we are only interested in the use of formal, written guidelines such as those generated by physician organizations, insurance companies or HMOs, or other such groups.
- _____ (643)

EFPROFL

- E. How large an effect do the results of practice profiles comparing your pattern of using medical resources to treat patients with that of other physicians have on your practice of medicine (INTERVIEWER NOTE: We are not interested in informal feedback, but only specific, quantified information about the physician*s practice patterns.) (If necessary, read:) A practice profile is a report that is usually computer generated which compares you to other physicians on things like referrals to specialists, hospitalizations, or other measures of cost-effectiveness.
- _____ (645)

EFSURV

- F. How large an effect does feedback from patient satisfaction surveys have on your practice of medicine

(READ:)

I am going to read a description of a patient and I'll ask about a possible test, treatment, or recommendation. We want you to think about patients with similar problems you've seen in your own practice during the past twelve months. The key question I'll ask is for what percentage of the patients with that problem would you recommend the test, treatment, or evaluation? Reasons for not recommending the treatment may include feeling that no treatment, or that an alternative treatment, is a better option. Any percentage, from zero to 100 percent, is a valid response.

(If code "2" or "8-9" in #A4, read:) As you answer, please think only about your main practice.

(If code "2" in "FORM", Skip to #E11;
Otherwise, Continue)

E1. (If code "1" or "3" in "FORM", ask:) What about treating an elevated cholesterol with oral agents for a 50 year old man who has no other cardiac risk factors except elevated cholesterol? After six months on a low cholesterol diet, his total cholesterol is 240 and his LDL is 150. His HDL cholesterol is 50, giving a ratio of total cholesterol to HDL cholesterol of 4.8. For what percentage of such patients would you recommend oral agents at this point? (Open ended and code actual percent) (Probe:) Your best estimate will be fine. (If necessary, read:) Consider all your patients with similar clinical descriptions.

Appendix C

Derivation of Standard Error Look-up Tables

Appendix C

Derivation of Standard Error Look-up Tables

The standard errors in the tables in Appendix D were derived as follows.¹

C.1. Percentages

To calculate standard errors for percentages (Tables D.1 through D.9), a representative set of categorical variables from the CTS Physician Survey was selected. These representative variables can be grouped into the following categories:

- Practice type and ownership: PRCTYPE, MULTPR, C5OWNER,² OWNPR, NWMCAID
- Board certification: BDCERT
- Compensation: ELIGBON, SALWAGE³
- Opinion questions: CARSAT, CLNFREE, CMPEXPC, EFGUIDE, EFPROFL, EFSURV, HIGHCAR, NEGICCN, OBHOSP, OBOUTPT, SQUAL

These variable names (other than the compensation variables) can be cross-referenced in the CTS Physician Survey Public Use File Codebook.

For each categorical variable with more than two possible values, we created a series of dichotomous variables--one for each possible response. Each dichotomous variable indicates whether the respondent chose that category (value set to one) or one of the other categories (value set to zero).

Weighted percentages and associated standard errors and design effects were produced for these variables using SUDAAN software (release 7.5, SAS-callable for Windows 95 and NT, Taylor Series default option for variance estimation) for 2 estimate types and 13 population subgroups:

¹The methods used were based on those described in "Sample Design, Sampling Weights, Imputation, and Variance Estimation in the 1995 National Survey of Family Growth," *Vital and Health Statistics*, Series 2, No. 124, February 1998, National Center for Health Statistics.

²This variable underwent masking for the Public Use File and is included as C5OWNX.

³These two variables were not included on the file in their original forms due to confidentiality considerations. The variables BONUS, SALPAID, SALTIME, and SALADJ, included on both the Restricted and Public Use Files, provide compensation information.

- Estimate Types
 - National estimates, site sample only
 - National estimates, supplemental sample only

- Physician Subgroups
 - All physicians
 - All primary care physicians (PCPFLAG=1)
 - All non-primary care physicians (PCPFLAG=0)
 - Internal medicine physicians (SPECX=1)
 - Family/general practice physicians (SPECX=2)
 - General pediatricians (SPECX=3)
 - Medical specialists, including psychiatrists (SPECX=4,6)
 - Surgical specialists, including OB-GYNs (SPECX=5,7)
 - Physicians in solo or two-person practice (PRCTYPE=1)
 - Physicians in group practice of three or more (PRCTYPE=2)
 - Physicians in other practice settings (PRCTYPE=3,4,5,6)
 - Physicians in practice with managed care revenue above median of 35 percent (PMC>35)
 - Physicians in practice with managed care revenue at or below median (PMC<36)

The output from the SUDAAN runs was then saved in several data files, which were used to derive regression models in SAS. The goal here was to derive a generalized function to predict design effects, given the size of the estimate and the unweighted sample size.

Before these models were run, estimates with an unweighted sample size of less than 100, a relative standard error of greater than 0.3,⁴ or a particularly small or large design effect⁵ were flagged as outliers and excluded from the regression runs. For the remaining estimates, a \log_{10} transformation was used for the point estimate (p), for its complement ($q=1-p$), for the design effect ($DEFF$), and for the unweighted sample size (n_u).

A series of linear regression models (SAS's PROC REG) was fit, using the categorical variables specified above. If the model was not significant (at $\alpha=.10$) with all three independent variables, or if the model was significant but any of the three coefficients was not significant (at $\alpha=.10$), independent variables were dropped until the best model was fit.⁶ The models were specified as:

⁴The relative standard error is calculated as the standard error of an estimate divided by the estimate. It is used as a measure of the instability of an estimate.

⁵If greater than 20 or less than 0.8.

⁶These models predict design effects with less error than that which occurs when one simply uses a mean or median design effect; however, their predictive power is relatively low. The R^2 for these models ranged from .088 to .318. To estimate design effects with greater confidence, you would need to use the Restricted Use File with specialized software to calculate them directly.

$$\hat{D} = \log_{10}(DEFF) = b_o + b_1 \log_{10}(n_u) + b_2 \log_{10}(p) + b_3 \log_{10}(q).$$

These models were run for categorical variables (excluding outliers) for the 26 combinations of estimate types and population subgroups described above.

For national estimates, the models for internal medicine physicians, family/general practice physicians, medical specialists, and physicians in group practice were not significant. For the remaining subgroups, design effects were derived by combining the predicted design effects for national estimates from the site sample and from the supplemental sample (based on the model above) in a linear fashion as follows:

$$DEFF(comb) = \frac{\lambda^2 DEFF_{site}}{p_{site}} + \frac{(1-\lambda)^2 DEFF_{supp}}{p_{supp}}$$

where $DEFF_i = 10^{\hat{D}_i}$ is the anti-log of the predicted \log_{10} design effect \hat{D}_i based on the associated regression model for sample i (site or supplement), p_i is the proportion of the combined unweighted (nominal) sample size contributed by sample i ,⁷ and λ is the proportion of the total effective sample size⁸ for the combined sample attributable to the site sample. This design effect $DEFF(comb)$ was then used in the following standard error formula to produce the tables:

$$S.E.(p) = \sqrt{\frac{p \cdot q \cdot DEFF(comb)}{n_u - 1}}.$$

C.2. Means of Quasi-Continuous Variables

As described in Chapter 3, “quasi-continuous” variables are those with responses that are expressed in terms of percentages and whose values are therefore bounded by 0 and 100. To calculate standard errors for these means (Tables D.10 through D.21), the following representative set of quasi-continuous variables from the CTS physician survey was selected:

- Percent values from vignettes: VCOUGH, VHYPER

⁷A value of 0.89 for p_{site} (and 0.11 for p_{supp}) was used in deriving the tables.

⁸The effective sample size is calculated as the nominal sample size divided by the design effect. The average value of 0.8606 for λ , incorporated in the combined weights, was used in deriving the tables.

- Percent of patients for whom physician is a gatekeeper: PCTGATE
- Percent income, payments, revenue from various sources: PMC, PBIGCON, PCAPREV, PMCARE, PMCAID, PCTINC⁹

These variable names can be cross-referenced in the CTS Physician Survey Public Use File Codebook.

Weighted means and associated standard errors and design effects were produced for these variables using SUDAAN software for the same combinations of estimate types and population subgroups described above for percentage estimates.

The goal for the quasi-continuous variable means was to derive a generalized function to predict standard errors, given the unweighted sample size and the weighted mean.

Before these models were run, estimates with an unweighted sample size of less than 100, a relative standard error of greater than 0.3, or a particularly small or large design effect¹⁰ were flagged as outliers and excluded from the regression runs. For the remaining estimates, a \log_{10} transformation was used for the standard error (SE), for the unweighted sample size (n_u) and for the weighted mean ($mean_w$).

A series of linear regression models was fit, using the quasi-continuous variables specified above. If the model was not significant with both independent variables, the best model was fit.¹¹ The models were specified as:

$$\hat{S} = \log_{10}(SE) = b_o + b_1 \log_{10}(n_u) + b_2 \log_{10}(mean_w).$$

These models were run for quasi-continuous variables (excluding outliers) for the 26 combinations of estimate types and population subgroups described above.

For national estimates, the models for general pediatricians were not significant. For the remaining subgroups, standard errors were derived by combining the predicted standard errors for national estimates from the site sample and from the supplemental sample (based on the model above) as follows:

⁹This variable underwent masking for the Public Use File and is included as PCTINCX.

¹⁰If greater than 20 or less than 0.8.

¹¹The R^2 for these models ranged from .333 to .899.

$$\hat{SE}(comb) = \sqrt{(n_{site} + n_{supp}) \left[\frac{\lambda^2 (\hat{SE}_{site})^2}{n_{site}} + \frac{(1-\lambda)^2 (\hat{SE}_{supp})^2}{n_{supp}} \right]}$$

where n_i is the unweighted sample size for sample i (site or supplement), \hat{SE}_i is the anti-log of the predicted \log_{10} standard error based on the associated regression model for sample i , and λ is the value defined previously (.8606).

C.3. Small Cell Size Warning

If the number of observations used in your estimate is less than 100, your estimate is likely to be unstable, and you should not use the relevant table in Appendix D to obtain an estimate of the standard error.
